

Three Questions

- ◆ How can approaches to CBA address uncertain future event probabilities?
- ◆ Is the additional information generated by a full CBA worth the additional investment required? What are the relative benefits and limitations of full versus partially quantitative and qualitative approaches?
- ◆ What do the case studies and cost-benefit analyses tell us about the viability and role of different approaches to DRR under changing climatic conditions.
 - ◆ Which approaches might be robust under differing climate scenarios?
 - ◆ Which depend heavily on the accuracy of climate projections?
